PROJECT NARRATIVE

Basis for the Data Validation

This report summarizes the results of data validation performed on groundwater and quality control (QC) sample data for the Seattle Iron and Metal – Phase 1 Dust Monitoring project. The data received full validation (EPA Stage 4). A complete list of samples is provided in the Sample Index.

ALS Life Sciences, Burlington, Ontario, Canada performed the analyses. The analytical methods and EcoChem project chemists are listed in the table below.

ANALYSIS	METHOD	PRIMARY REVIEW	SECONDARY REVIEW
Dioxin/Furans	EPA TO9A/M23/8290	C. Ransom	C. Frans
PCB Congeners	EPA TO10A/1668C		

The data were reviewed using guidance and quality control criteria documented in the analytical methods; *Seattle Iron & Metals Dust Monitoring Plan: Phase I* (In consultation with Sahu, R., July, 2019); and *National Functional Guidelines for High Resolution Superfund Methods Data Review* (USEPA 2016).

EcoChem's goal in assigning data assessment qualifiers is to assist in proper data interpretation. If values are estimated (J or UJ), data may be used for site evaluation and risk assessment purposes but reasons for data qualification should be taken into consideration when interpreting sample concentrations. If values are assigned an R or DNR, the data should not be used for any site evaluation purposes. If values have no data qualifier assigned, then the data meet the data quality objectives as stated in the documents and methods referenced above.

Data qualifier definitions, reason codes, and validation criteria are included as Appendix A. A Qualified Data Summary Table is included in Appendix B. Data Validation Worksheets will be kept on file at EcoChem, Inc. A qualified laboratory electronic data deliverable (EDD) is also submitted with this report.

DATA VALIDATION REPORT
Seattle Iron and Metal – Air Monitoring
Dioxins by EPA Methods TO9A/M23/8290

This report documents the review of analytical data from the analysis of air monitoring PUF filter samples and the associated laboratory quality control (QC) samples. ALS Life Sciences, Burlington, Ontario, Canada analyzed the samples. Refer to the **Sample Index** for a complete list of samples.

DATA PACKAGE COMPLETENESS

The laboratory submitted all required deliverables. The laboratory followed adequate corrective action processes and all anomalies were discussed in the case narrative.

EDD TO HARDCOPY VERIFICATION

A verification of the electronic data deliverable (EDD) results was performed by comparison of a percentage of the results to the hardcopy laboratory data package. The following changes were made:

The QC table contained records for the target analytes for all field samples. These records were deleted. Only the labeled compounds were retained for field samples in the QC table.

Records for field standards were removed for method blanks and laboratory control samples. These spikes do not apply to these laboratory QC samples.

Records for homolog groups and TEQ ranges were deleted for laboratory control samples in the QC table.

Batch WG3136778: The result field in the QC table was not populated for the field standards, cleanup standards, or surrogates. The values were added to the EDD using the results in the raw data.

The matrix, extraction method, and analysis method were changed in the Result Table and the QC Table to match the other two batches.

FIELD	ORIGINAL	REVISED
Matrix	Air	PUF
Extraction Method	EPA M23	EPA TO9A
Analysis Method	EPA M23	EPA TO9A

TECHNICAL DATA VALIDATION

The QC requirements that were reviewed are listed below:

2	Sample Receipt, Preservation and Holding Times	1	Laboratory Control Samples
✓	Instrument Performance Check	1	Matrix Spikes/Matrix Spike Duplicates (MS/MSD)
✓	Initial Calibration (ICAL)	1	Field Duplicates
✓	Continuing Calibration Verification (CCV)	✓	Reporting Limits and Sample Quantitation
2	Laboratory Blanks	✓	Target Analyte List
2	Field Standards	2	Compound Identification
1	Extraction Standards	✓	Calculation Verification
1	Cleanup Standards		

✓ Stated method quality objectives (MQO) and QC criteria have been met. No outliers are noted or discussed.

1 Quality control results are discussed below, but no data were qualified.

2 Quality control outliers that impact the reported data were noted. Data qualifiers were issued as discussed below.

Sample Receipt, Preservation, and Holding Times

Some sample coolers arrived at temperatures greater than the advisory temperature of 6°C, with temperatures ranging from 6.8 °C to 24.2 °C. Data were not affected by the temperature outliers; no action was taken.

L2310263: All samples were extracted after the EPA Method 23 and EPA 8290 holding time of 30 days. All results were estimated (J/UJ-1).

L2322808: Sample CITY-20190725-0801 was listed on the COC but was not received. The sample was received at a later date and reported in SDG L2327824.

L2327824: Sample CITY-20190725-0801 was extracted after the EPA Method 23 and EPA 8290 holding time of 30 days. All results for this sample were estimated (J/UJ-1).

Laboratory Blanks

To assess the impact of any blank contaminant on the reported sample results, an action level was established at five times (5x) the concentration reported in the blank. If a contaminant was reported in an associated field sample and the concentration was less than the action level, the result was qualified as not detected (U-7). The laboratory assigned R-flags to values when a peak was detected but did not meet identification criteria. These values cannot be considered as positive identifications but are "estimated maximum possible concentrations" (EMPCs). When these occurred in the method blank the results were considered as false positives. No action levels were established for these analytes.

Method blanks were analyzed at the appropriate frequency. Two types of blanks were analyzed: media blanks and reagent blanks. Several target analytes were detected in the method blanks; however, only the following analytes required qualification in one or more of the associated samples:

BATCH	METHOD BLANK	BLANK TYPE	ANALYTE	CONCENTRATION (PG)
WG3081836	WG3081836-1	Media Blank	OCDD	5.48
			2,3,4,6,7,8-HxCDF	0.5
WG3116369	WG3116369-1	Media Blank	1,2,3,7,8,9-HxCDF	1.11
			OCDF	3.42
	WG3116369-4	Reagent Blank	OCDD	8.95
WG3136778	WG3136778-1	Media Blank	OCDF	2.42
	WG3136778-4	Reagent Blank	1,2,3,4,6,7,8-HpCDD	6.58
			OCDD	21.7

Field Standards

Five labeled compounds were added to the sample cartridges prior to sampling. The percent recovery (%R) values method specified control limits are 70-130%. These surrogates are used to evaluate the sampling system. No action was taken unless three or more of the compounds were outside of the control limits. If the recoveries indicated a potential problem with the sampling set-up, all results for the sample were estimated (J/UJ-13). The following samples were qualified based on surrogate recovery outliers.

SDG L2294320: The PUF cartridges were not spiked with the field standards. All results were estimated (J/UJ-13) due to the lack of information regarding the functioning of the sampling system.

SDG L2327824: For Sample HEISER-20190801-0808, 3 of the 5 surrogate recoveries were <70%. All results, including total homologs, were estimated (J/UJ-13L) to indicate a potential low bias.

Extraction Standards

Nine labeled compounds were added as internal standards to each sample prior to extraction. Recoveries were within the method criteria of 40-130% (25-130% for hepta and octa-chlorinated compounds).

Cleanup Standards

Batch WG3081836: The cleanup standard 13C12-1,2,3,7,8,9-HxCDF was not added. This does not impact sample quantitation. The recoveries for all extraction standards were acceptable; no action was taken on this basis.

Laboratory Control Samples

Laboratory control samples (LCS) were analyzed with each batch. All recoveries were within the control limits of 70%-130%.

Matrix Spikes/Matrix Spike Duplicates

Matrix spike/matrix spike duplicates (MS/MSD) were not analyzed. These are not required by the method. Accuracy was assessed using labeled compound and LCS recoveries. Precision within an analytical batch could not be evaluated.

Field Duplicates

No field duplicates were submitted.

Compound Identification

The laboratory reported EMPC or "estimated maximum possible concentrations" values for one or more of the target analytes in all samples. An EMPC value was reported when a peak was detected but did not meet identification criteria as required by the method; therefore, the result cannot be considered as positive identification for the analyte. The lab flagged these results "R". All EMPC results were qualified as not-detected (U-25) at the reported concentrations.

The laboratory uses DB5 MS column, which provides adequate resolution of the TCDF isomers as indicated by the acceptable peak to valley ratios. There were no positive results for 2,3,7,8-TCDF in the field samples. No second column confirmation was necessary.

Calculation Verification

Several results were verified by recalculation from the raw data. No calculation or transcription errors were noted.

OVERALL ASSESSMENT

As was determined by this evaluation, the laboratory followed the specified analytical methods. With the exceptions noted above, accuracy was acceptable as demonstrated by the labeled compound and LCS recoveries. Precision within an analytical batch could not be evaluated.

Detection limits were elevated due to method blank contamination and ion ratio outliers. Results were estimated based on exceeded holding times and field standard recovery outliers.

All data, as qualified, are acceptable for use.

DATA VALIDATION REPORT

Seattle Iron and Metal – Air Monitoring

PCB Congeners by EPA Method 1668C

This report documents the review of analytical data from the analysis of air monitoring PUF filter samples and the associated laboratory and field quality control (QC) samples. ALS Life Sciences, Burlington, Ontario, Canada analyzed the samples. Refer to the **Sample Index** for a complete list of samples.

SDG	BATCH	NUMBER OF SAMPLES	VALIDATION LEVEL
L2294320 L23011798 L2308151	WG3081836	3 PUF 3 PUF 3 PUF	EPA Stage 4
L2310263 L2316030 L2320141 L2332808	WG3116369	3 PUF 3 PUF 3 PUF 2 PUF	EPA Stage 4
L2327284 L2336381	WG3136778	4 PUF 6 PUF	EPA Stage 4

DATA PACKAGE COMPLETENESS

The laboratory submitted all required deliverables. The laboratory followed adequate corrective action processes and all anomalies were discussed in the case narrative.

Batch WG311639: The raw data for the reagent blank, WG311639-4, was missing from the data packages. The lab was contacted and supplied the missing documentation.

Batch WG3136778: The raw data for the wrong LCS (Batch WG3150231) was included in the data package. The lab was contacted and provided the missing raw data for LCS WG3136778-2.

EDD TO HARDCOPY VERIFICATION

A verification of the electronic data deliverable (EDD) results was performed by comparison of a percentage of the results to the hardcopy laboratory data package. No transcription errors were noted. The following changes were made:

- The results table contained records for the labeled compounds (surrogate, field standard, and cleanup standards). These should only be in the QC table; the records were deleted from the results table.
- The records for field standards for the method blanks and laboratory control samples were removed from the QC table. These standards do not apply for laboratory QC.

Batch WG3116369: The records for Total MonoCB, Total DiCB, Lower Bound PCB TEQ and Mid Point PCB TEQ were missing from QC samples WG3116369-1 and WG3116369-4. The missing data was added to the table using the information on the data package summary forms.

The QC table was missing records for cleanup standards 13C12 PCB-028 and 13C12 PCB-111. These missing results were copied from the results table and added to the QC table.

Batch WG3136778: The matrix was changed to PUF in the Result and QC tables to match the other batches.

The true values and the percent recovery values for the field standards in the QC table were incorrect. The true value was corrected from 4000 to 6000 and the percent recoveries were changed to match the hardcopy.

TECHNICAL DATA VALIDATION

The QC requirements that were reviewed are listed below:

1	Sample Receipt, Preservation and Holding Times	1	Laboratory Control Samples
✓	Instrument Performance Check	1	Matrix Spikes/Matrix Spike Duplicates (MS/MSD)
✓	Initial Calibration (ICAL)	1	Field Duplicates
✓	Continuing Calibration Verification (CCV)	✓	Reporting Limits and Sample Quantitation
2	Laboratory Blanks	✓	Target Analyte List
2	Field Standards	2	Compound Identification
1	Extraction Standards	1	Calculation Verification
1	Cleanup Standards		

✓ Stated method quality objectives (MQO) and QC criteria have been met. No outliers are noted or discussed.

1 Quality control results are discussed below, but no data were qualified.

2 Quality control outliers that impact the reported data were noted. Data qualifiers were issued as discussed below.

Sample Receipt, Preservation, and Holding Times

Some sample coolers arrived at temperatures greater than the advisory temperature of 6°C, with temperatures ranging from 6.8 °C to 24.2 °C. Data were not affected by the temperature outliers; no action was taken.

L2322808: Sample CITY-20190725-0801 was listed on the COC but was not received. The sample was received at a later date and reported in SDG L2327824.

Laboratory Blanks

To assess the impact of any blank contaminant on the reported sample results, an action level is established at five times (5x) the concentration reported in the blank. If a contaminant is reported in an associated field sample and the concentration is less than the action level, the result is qualified as not detected (U-7). No action is taken if the sample result is greater than the action level, or for non-detected results. The laboratory assigned EMPC-flags to values when a peak was detected but did not meet identification criteria. These values cannot be considered as positive identifications but

are "estimated maximum possible concentrations". When these occurred in the method blank the results were considered as false positives. No action levels were established for these analytes.

Method blanks were analyzed at the appropriate frequency. Several target analytes were detected in the method blanks; however, only the following analytes required qualification in one or more of the associated samples:

BATCH	METHOD BLANK	BLANK TYPE	ANALYTE	CONCENTRATION (PG)
WG3081836	WG3081836-1	Media Blank	PCB-018/030	9.54
			PCB-022	7.55
			PCB-090/101/113	5.52
			PCB-118	3.52
			PCB-147/149	3.04
			PCB-194	1.96
WG3116369	WG3116369-1	Media Blank	PCB-011	60.6
			PCB-020/028	18.4
			PCB-052	15.2

			PCB-061/070/074/076	11.8
			PCB-066	7.21
			PCB-056	4.74

Field Standards

Labeled compounds were added to the sample cartridges prior to sampling. The percent recovery (%R) control limits are 70-130%. These surrogates are used to evaluate the sampling system. No action was taken if only one of the recoveries was outside of the control limits. If the recoveries indicated a potential problem with the sampling set-up, all results for the sample were estimated (J/UJ-13). The following samples were qualified based on field standard results:

SDG L2294320: The PUF cartridges were not spiked with the field standards. All results were estimated (J/UJ-13) due to the lack of information regarding the functioning of the sampling system.

Extraction Standards

Labeled compounds were added as internal standards to each sample prior to extraction. Recoveries were within the method criteria.

Cleanup Standards

Batch WG3081836: The cleanup standards were not added. This does not impact sample quantitation. The recoveries for all extraction standards were acceptable; no action was taken on this basis.

Laboratory Control Samples

Laboratory control samples (LCS) were analyzed with each batch. All recoveries were within the control limits of 70%-130%.

Matrix Spikes/Matrix Spike Duplicates

Matrix spike/matrix spike duplicates (MS/MSD) were not analyzed. These are not required by the method. Accuracy was assessed using labeled compound and laboratory control sample recoveries. Precision could not be assessed.

Field Duplicates

No field duplicates were submitted.

Compound Identification

The laboratory reported EMPC or "estimated maximum possible concentrations" values for one or more of the target analytes in all samples. An EMPC value was reported when a peak was detected but did not meet identification criteria as required by the method; therefore, the result cannot be considered as positive identification for the analyte. The lab flagged these results "R". All EMPC results were qualified as not-detected (U-25) at the reported concentrations.

Calculation Verification

Several results were verified by recalculation from the raw data. No calculation or transcription errors were noted.

OVERALL ASSESSMENT

As was determined by this evaluation, the laboratory followed the specified analytical methods. With the exceptions noted above, accuracy was acceptable as demonstrated by the labeled compound and LCS recoveries. Precision within the batches could not be assessed.

Detection limits were elevated due to blank contamination and ion ratio outliers. Results were estimated based on field standard results.

All data, as qualified, are acceptable for use.

APPENDIX A

DATA QUALIFIER DEFINITIONS REASON CODES AND CRITERIA TABLES

DATA VALIDATION QUALIFIER CODES

Based on National Functional Guidelines

The following definitions provide brief explanations of the qualifiers assigned to results in the data review process.

- U** The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J** The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- NJ** The analysis indicates the presence of an analyte that has been “tentatively identified” and the associated numerical value represents the approximate concentration.
- UJ** The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R** The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

The following is an EcoChem qualifier that may also be assigned during the data review process:

- DNR** Do not report; a more appropriate result is reported from another analysis or dilution.
-
